SpanWright

at first floor level

With the modern home full of risks especially with regard to fire, concrete floors upstairs provide a barrier to fire unlike traditional floors. This makes concrete flooring an essential consideration for every house owner.

Safety

Sound Insulation

The benefits of concrete for reducing sound transfer have been realised and used in Irish house construction for years. The use of concrete floor slabs between levels has proven to cut noise transfer by over 50%.

Using concrete floors instead of timber also eliminates creaking floor joists.

Using concrete floor slabs at first floor level makes fitting of the first floor much faster. Floors can be delivered soon after the completion of block work as they are held in stock. Having a floor ready for builders to work on fast tracks the construction process.

Speed

Special Features

SpanWright has been specially designed for use in houses. Unique features of the product have been tailored to bring a variety of options as well as savings to the customer.

Features include facility for plastering direct, moulded inserts for fixing ceilings, a flat surface for fixing floors upstairs and increased options for under floor heating.
